

ESG Data Visualization Wireframe

Task

Create a wireframe for an application that displays ESG (Environmental, Social, and Governance) information about different companies, prioritizing data density and highlighting important information. The wireframe should be clear and pragmatic, and the design should take into account that we want to see the data for different points in time.

Instructions

Using your preferred wireframing tool, create a wireframe for the application.

The wireframe should include the following features: a. A search function to easily search for a specific company. b. A clear display of ESG data for each company, with separate scores for Environmental, Social, and Governance aspects. c. Functionality that allows you to view the esg data as it was at a point of time in the past. d. A method to visually highlight important statistics and scores.

Keep the overall design focused on data density and usability, rather than style.

Spend about 1 hour on this.

Deliverables

Submit your wireframe as a PDF, PNG, or JPEG file. Include a brief explanation of the design choices you made and how they address the priorities outlined in the application brief.
